April 22nd 2007

SEVEN clusters of cancer and other serious illnesses have been discovered around mobile phone masts, raising concerns over the technology's potential impact on health.

Studies of the sites show high incidences of cancer, brain haemorrhages and high blood pressure within a radius of 400 yards of mobile phone masts.

One of the studies, in Warwickshire, showed a cluster of 31 cancers around a single street. A quarter of the 30 staff at a special school within sight of the 90ft high mast have developed tumours since 2000, while another quarter have suffered significant health problems.

A Cluster
(or Rather, Clusters)
Around a Mast on a
Water Tower (Inset)
in Lincolnshire

Shown above is one of Dr Walker's many unfunded but well researched Cancer clusters found in the points of maximum intensity of the transmission and reception beam from this mobile phone mast nobody pays Dr Walker for this he is just concerned for humanity. Note how the dots, representing Cancer cases (ill people) lie in, and in a few cases very close to, the maximum intensity areas (coloured orange, then lime-green), thinning out in the areas of slightly lesser intensity (paler green), and are almost totally absent from the least intense areas (pale blue then darker blue).

In simple terms, if the odds of one such cluster are one in a thousand then the odds of two are that squared - one in a million. The odds of three are the cube - one in a billion - and so it goes on.
